Use inductively:

## Theorem (Lagrange)

*Let  $H < G$  then  $|G| = [G : H] \cdot |H|$ .*

# The group order

Recall  $H \backslash G := \{Hg \mid g \in G\}$  and  $[G : H] := |H \backslash G|$ .

Use inductively:

## Theorem (Lagrange)

*Let  $H < G$  then  $|G| = [G : H] \cdot |H|$ .*

Since we **know all orbit lengths**, we know the indices  
 $[S_{i-1} : S_i] = |S_{i-1}| / |S_i|$ .

# The group order

Recall  $H \backslash G := \{Hg \mid g \in G\}$  and  $[G : H] := |H \backslash G|$ .

Use inductively:

## Theorem (Lagrange)

Let  $H < G$  then  $|G| = [G : H] \cdot |H|$ .

Since we **know all orbit lengths**, we know the indices  
 $[S_{i-1} : S_i] = |S_{i-1}| / |S_i|$ .

## Fact

*We know the group order*

$$|G| = [S_0 : S_1] \cdot [S_1 : S_2] \cdots [S_{k-1} : S_k] \cdot$$

$l_1 \quad \cdot \quad l_2 \quad \cdots \quad l_k$

# Transversals

Even better, the Orbit-Stabiliser-Algorithm provides the **Schreier tree** and thus **words in the generators** to **reach the orbit points**.

# Transversals

Even better, the Orbit-Stabiliser-Algorithm provides the **Schreier tree** and thus **words in the generators** to **reach the orbit points**.

These words form **transversals**: We have elements  $t_j^{(i)}$  for  $1 \leq i \leq k$  and  $1 \leq j \leq \ell_i$  with:

$$S_{i-1} = \bigcup_{j=1}^{\ell_i} S_i t_j^{(i)} \quad (\text{disjoint union}).$$

# Transversals

Even better, the Orbit-Stabiliser-Algorithm provides the **Schreier tree** and thus **words in the generators** to **reach the orbit points**.

These words form **transversals**: We have elements  $t_j^{(i)}$  for  $1 \leq i \leq k$  and  $1 \leq j \leq \ell_i$  with:

$$S_{i-1} = \bigcup_{j=1}^{\ell_i} S_i t_j^{(i)} \quad (\text{disjoint union}).$$

Therefore,  $g \in G$  can be written uniquely in the form

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \cdot \dots \cdot t_{j_1}^{(1)}$$

for some numbers  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for all  $i$ .

# Transversals

Even better, the Orbit-Stabiliser-Algorithm provides the **Schreier tree** and thus **words in the generators** to **reach the orbit points**.

These words form **transversals**: We have elements  $t_j^{(i)}$  for  $1 \leq i \leq k$  and  $1 \leq j \leq \ell_i$  with:

$$S_{i-1} = \bigcup_{j=1}^{\ell_i} S_i t_j^{(i)} \quad (\text{disjoint union}).$$

Therefore,  $g \in G$  can be written uniquely in the form

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \cdot \dots \cdot t_{j_1}^{(1)}$$

for some numbers  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for all  $i$ .

Yet better, the **stabiliser chain** allows us to **read off** these numbers!

# Sifting

Assume  $g \in G$ , thus:

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_1}^{(1)}$$

for  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for  $1 \leq i \leq k$ .

Introduction

GAP examples

algorithms

Nearly linear time

Worse

A problem

# Sifting

Assume  $g \in G$ , thus:

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_1}^{(1)}$$

for  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for  $1 \leq i \leq k$ .

Since the first  $k - 1$  of these lie in  $S_1$ , they all fix  $x_1$ .

# Sifting

Assume  $g \in G$ , thus:

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_1}^{(1)}$$

for  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for  $1 \leq i \leq k$ .

Since the first  $k - 1$  of these lie in  $S_1$ , they all fix  $x_1$ .

Thus  $x_1 g \in O_1$  depends only on  $j_1$  and not on the other  $j_i$ !

# Sifting

Assume  $g \in G$ , thus:

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_1}^{(1)}$$

for  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for  $1 \leq i \leq k$ .

Since the first  $k - 1$  of these lie in  $S_1$ , they all fix  $x_1$ .

Thus  $x_1 g \in O_1$  depends only on  $j_1$  and not on the other  $j_i$ !

So, we compute  $x_1 g \in O_1$ , look it up and determine  $j_1$ .

# Sifting

Assume  $g \in G$ , thus:

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_1}^{(1)}$$

for  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for  $1 \leq i \leq k$ .

Since the first  $k - 1$  of these lie in  $S_1$ , they all fix  $x_1$ .

Thus  $x_1 g \in O_1$  depends only on  $j_1$  and not on the other  $j_i$ !

So, we compute  $x_1 g \in O_1$ , look it up and determine  $j_1$ .

Now

$$g_1 := g t_{j_1}^{(1)-1} = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_2}^{(2)}$$

fixes  $x_1$  and thus lies in  $S_1$ .

# Sifting

Assume  $g \in G$ , thus:

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_1}^{(1)}$$

for  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for  $1 \leq i \leq k$ .

Since the first  $k - 1$  of these lie in  $S_1$ , they all fix  $x_1$ .

Thus  $x_1 g \in O_1$  depends only on  $j_1$  and not on the other  $j_i$ !

So, we compute  $x_1 g \in O_1$ , look it up and determine  $j_1$ .

Now

$$g_1 := g t_{j_1}^{(1)-1} = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_2}^{(2)}$$

fixes  $x_1$  and thus lies in  $S_1$ .

We can now compute  $x_2 g_1 \in O_2$  and determine  $j_2, \dots, j_k$  inductively.

# Sifting

Assume  $g \in G$ , thus:

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_1}^{(1)}$$

for  $j_1, j_2, \dots, j_k$  with  $1 \leq j_i \leq \ell_i$  for  $1 \leq i \leq k$ .

Since the first  $k - 1$  of these lie in  $S_1$ , they all fix  $x_1$ .

Thus  $x_1 g \in O_1$  depends **only on  $j_1$**  and **not on the other  $j_i$ !**

So, we compute  $x_1 g \in O_1$ , look it up and **determine  $j_1$** .

Now

$$g_1 := g t_{j_1}^{(1)-1} = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \dots t_{j_2}^{(2)}$$

fixes  $x_1$  and thus lies in  $S_1$ .

We can now compute  $x_2 g_1 \in O_2$  and **determine  $j_2, \dots, j_k$  inductively**.

This procedure is called **sifting**.

## Membership test

If we sift an element  $g \notin G$  (for example, if  $G \leq \Sigma_n$  and  $g \in \Sigma_n \setminus G$ ), then **something will go wrong**:

## Membership test

If we sift an element  $g \notin G$  (for example, if  $G \leq \Sigma_n$  and  $g \in \Sigma_n \setminus G$ ), then **something will go wrong**:

- if  $x_1 g \notin O_1 = x_1 G$ : then we proved that  $g \notin G$ ,

## Membership test

If we sift an element  $g \notin G$  (for example, if  $G \leq \Sigma_n$  and  $g \in \Sigma_n \setminus G$ ), then **something will go wrong**:

- if  $x_1 g \notin O_1 = x_1 G$ : then we proved that  $g \notin G$ ,
- if  $x_1 g = x_1 t_j^{(1)}$  for some  $1 \leq j \leq \ell_1$ , then:

since  $t_j^{(1)} \in G$  and  $x_1 g t_j^{(1)-1} = x_1$ , we have

$$g \in G \iff g t_j^{(1)-1} \in S_1.$$

$\implies$  Inductively, we test membership in the stabiliser.

## Membership test

If we sift an element  $g \notin G$  (for example, if  $G \leq \Sigma_n$  and  $g \in \Sigma_n \setminus G$ ), then **something will go wrong**:

- if  $x_1 g \notin O_1 = x_1 G$ : then we proved that  $g \notin G$ ,
- if  $x_1 g = x_1 t_j^{(1)}$  for some  $1 \leq j \leq \ell_1$ , then:

since  $t_j^{(1)} \in G$  and  $x_1 g t_j^{(1)-1} = x_1$ , we have

$$g \in G \iff g t_j^{(1)-1} \in S_1.$$

$\implies$  Inductively, we test membership in the stabiliser.

### Theorem (Stabiliser chain and sifting)

Given  $G \leq \Sigma_n$ , an element  $g \in \Sigma_n$  and a stabiliser chain for  $G$  with its orbits and Schreier trees, we can sift it, and

## Membership test

If we sift an element  $g \notin G$  (for example, if  $G \leq \Sigma_n$  and  $g \in \Sigma_n \setminus G$ ), then **something will go wrong**:

- if  $x_1 g \notin O_1 = x_1 G$ : then we proved that  $g \notin G$ ,
- if  $x_1 g = x_1 t_j^{(1)}$  for some  $1 \leq j \leq \ell_1$ , then:

since  $t_j^{(1)} \in G$  and  $x_1 g t_j^{(1)-1} = x_1$ , we have

$$g \in G \iff g t_j^{(1)-1} \in S_1.$$

$\implies$  Inductively, we test membership in the stabiliser.

### Theorem (Stabiliser chain and sifting)

Given  $G \leq \Sigma_n$ , an element  $g \in \Sigma_n$  and a stabiliser chain for  $G$  with its orbits and Schreier trees, we can sift it, and

- either prove that  $g \notin G$ ,

## Membership test

If we sift an element  $g \notin G$  (for example, if  $G \leq \Sigma_n$  and  $g \in \Sigma_n \setminus G$ ), then **something will go wrong**:

- if  $x_1 g \notin O_1 = x_1 G$ : then we proved that  $g \notin G$ ,
- if  $x_1 g = x_1 t_j^{(1)}$  for some  $1 \leq j \leq \ell_1$ , then:

since  $t_j^{(1)} \in G$  and  $x_1 g t_j^{(1)-1} = x_1$ , we have

$$g \in G \iff g t_j^{(1)-1} \in S_1.$$

$\implies$  Inductively, we test membership in the stabiliser.

### Theorem (Stabiliser chain and sifting)

Given  $G \leq \Sigma_n$ , an element  $g \in \Sigma_n$  and a stabiliser chain for  $G$  with its orbits and Schreier trees, we can sift it, and

- either prove that  $g \notin G$ ,
- or write  $g$  constructively in a unique way as product of transversal elements

$$g = t_{j_k}^{(k)} \cdot t_{j_{k-1}}^{(k-1)} \cdots t_{j_1}^{(1)}.$$

# Base and strong generators

Let  $G \leq \Sigma_n$  and  $G = S_0 > S_1 > \dots > S_k = \{1\}$  be a stabiliser chain. Let  $S$  be the set of **all generators of all the  $S_i$**  for  $0 \leq i < k$ .

# Base and strong generators

Let  $G \leq \Sigma_n$  and  $G = S_0 > S_1 > \dots > S_k = \{1\}$  be a stabiliser chain. Let  $S$  be the set of **all generators** of **all the  $S_i$**  for  $0 \leq i < k$ .

## Definition (Base and strong generators)

The points  $x_1, x_2, \dots, x_k$  together are called a **base** for  $G$ , since the only element  $g \in G$  fixing them all is the identity.

# Base and strong generators

Let  $G \leq \Sigma_n$  and  $G = S_0 > S_1 > \dots > S_k = \{1\}$  be a stabiliser chain. Let  $S$  be the set of all generators of all the  $S_i$  for  $0 \leq i < k$ .

## Definition (Base and strong generators)

The points  $x_1, x_2, \dots, x_k$  together are called a **base** for  $G$ , since the only element  $g \in G$  fixing them all is the identity. The set  $S$  is called a **set of strong generators** for  $G$ , since  $\langle S \cap S_i \rangle = S_i$  for  $0 \leq i \leq k$ .

# Base and strong generators

Let  $G \leq \Sigma_n$  and  $G = S_0 > S_1 > \dots > S_k = \{1\}$  be a stabiliser chain. Let  $S$  be the set of **all generators of all the  $S_i$**  for  $0 \leq i < k$ .

## Definition (Base and strong generators)

The points  $x_1, x_2, \dots, x_k$  together are called a **base** for  $G$ , since the only element  $g \in G$  fixing them all is the identity. The set  $S$  is called a **set of strong generators** for  $G$ , since  $\langle S \cap S_i \rangle = S_i$  for  $0 \leq i \leq k$ .

A stabiliser chain provides a **base** and a **strong generating set**.

# Base and strong generators

- the normaliser in  $\Sigma_n$ .

## Large base

One problem with stabiliser chains is  $\Sigma_n$  itself:

### Fact

*The smallest base for  $\Sigma_n$  itself contains  $n - 1$  points.  
Not surprising, since  $\log |G| = \log(n!) \approx n \log n - n$ .*

## Large base

One problem with stabiliser chains is  $\Sigma_n$  itself:

### Fact

*The smallest base for  $\Sigma_n$  itself contains  $n - 1$  points.  
Not surprising, since  $\log |G| = \log(n!) \approx n \log n - n$ .*

Thus, time  $n \log |T| \log^c |G|$  becomes  $n^{(c+1)} \log^c n \log |T|$ .

## Large base

One problem with stabiliser chains is  $\Sigma_n$  itself:

### Fact

*The smallest base for  $\Sigma_n$  itself contains  $n - 1$  points.  
Not surprising, since  $\log |G| = \log(n!) \approx n \log n - n$ .*

Thus, time  $n \log |T| \log^c |G|$  becomes  $n^{(c+1)} \log^c n \log |T|$ .

### Definition (Small-base family)

A family  $\mathcal{F}$  of permutation groups is called a family of **small-base** groups, if there is a constant  $c$  such that each  $G \in \mathcal{F}$  of degree  $n$  satisfies  $\log |G| \leq \log^c n$ .

## Large base
