--------------------	------	---

3

- Start at 0.
- Oss a fair coin.

э

- Start at 0.
- Itoss a fair coin.
- If head appears, then take a step +1 and if tail appears, then take a step -1.

- Start at 0.
- Oss a fair coin.
- If head appears, then take a step +1 and if tail appears, then take a step -1.
- Toss a fair coin in an independent fashion.

- Start at 0.
- Itoss a fair coin.
- If head appears, then take a step +1 and if tail appears, then take a step -1.
- Toss a fair coin in an independent fashion.
- If head appears, then take a step +1 and if tail appears, then take a step -1.

- Start at 0.
- Itoss a fair coin.
- If head appears, then take a step +1 and if tail appears, then take a step -1.
- Toss a fair coin in an independent fashion.
- If head appears, then take a step +1 and if tail appears, then take a step -1.
- Repeat 4 and 5 again and again.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

Start at 0.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

Start at 0.

2 Take a step i with probability p_i .

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start at 0.
- 2 Take a step *i* with probability p_i .
- In an *independent fashion*, take another step j with probability p_j.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start at 0.
- 2 Take a step i with probability p_i .
- In an *independent fashion*, take another step *j* with probability *p_j*.
- Repeat 3 again and again.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start at 0.
- 2 Take a step i with probability p_i .
- In an independent fashion, take another step j with probability p_j.
- Repeat 3 again and again.

In case of simple random walk, $p_1 = p_{-1} = \frac{1}{2}$ and all other p_i 's are 0.

Any branching random walk on integers

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

Start with one particle at position 0 (the zeroth generation).

Parthanil Roy (I.S.I.)

Any branching random walk on integers

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start with one particle at position 0 (the zeroth generation).
- 2 The particle branches into two particles.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start with one particle at position 0 (the zeroth generation).
- 2 The particle branches into two particles.
- Each new particle takes a step i with probability p_i independently of each other.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start with one particle at position 0 (the zeroth generation).
- Interpretion of the particle of the particles.
- Each new particle takes a step i with probability p_i independently of each other.
- This gives rise to the first generation.

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start with one particle at position 0 (the zeroth generation).
- Interpretion of the particle of the particles.
- Each new particle takes a step i with probability p_i independently of each other.
- This gives rise to the first generation.
- Seach particle repeats 2 and 3 independently of each other and this process goes on.

Parthanil Roy (I.S.I.)

May 14, 2018 18 / 32

For every integer *i*, fix a nonnegative real number p_i in such a way that the sum of all p_i 's is equal to 1.

- Start with one particle at position 0 (the zeroth generation).
- 2 The particle branches into two particles.
- Each new particle takes a step i with probability p_i independently of each other.
- This gives rise to the *first generation*.
- Each particle repeats 2 and 3 independently of each other and this process goes on.

For branching simple random walk, $p_1 = p_{-1} = \frac{1}{2}$ and other $p_i = 0$.

E SQC

Branching random walk on the real line

Everything is same as before except that step-sizes will no longer be integers. It can be any real (random) number.

Everything is same as before except that step-sizes will no longer be integers. It can be any real (random) number.

The number of offspring particles can also be a random nonnegative integer.

Everything is same as before except that step-sizes will no longer be integers. It can be any real (random) number.

The number of offspring particles can also be a random nonnegative integer.

This model was introduced by Hammerseley (1974), Kingman (1975) and Biggins (1976).

- It can be used to describe how a growing population (of bacteria, particles, etc.) invades a new environment.
- In our rather simplified model, we only allow the particles to move along a single line (or even integers).
- More complicated models can also be considered where particles move in a plane or in a box.

- Branching random walks appear in many contexts ranging from biology to statistical physics.
- It can be used to describe how a growing population (of bacteria, particles, etc.) invades a new environment.
- In our rather simplified model, we only allow the particles to move along a single line (or even integers).
- More complicated models can also be considered where particles move in a plane or in a box.
- For the purpose of this talk, we shall restrict ourselves to the simple model and talk about the *long run configuration* of the positions of particles.

Parthanil Roy (I.S.I.)

	•		છે ગ
Parthanil Roy (I.S.I.)	Branching random walk	May 14, 2018	21 / 32

 Recall that, a branching random walk is a growing collection of particles (or organisms) which starts from a single particle, branch and spread independently of their positions and of the other particles.

- Recall that, a branching random walk is a growing collection of particles (or organisms) which starts from a single particle, branch and spread independently of their positions and of the other particles.
- If we let the dynamics run for many many generations, how would the picture (or the snapshot) of the system look like?

- Recall that, a branching random walk is a growing collection of particles (or organisms) which starts from a single particle, branch and spread independently of their positions and of the other particles.
- If we let the dynamics run for many many generations, how would the picture (or the snapshot) of the system look like?
- The *long run configuration* is of great importance in statistical physics, mathematical biology and probability theory.
