(ロ)、(型)、(E)、(E)、 E) の(の)

Theoretically speaking ...

Through simple puzzles let us try to understand some aspects of Logic, Computation of Boolean Functions, and Coding Theory.

イロト 不得 トイヨト イヨト

Puzzle 1

<□ > < @ > < E > < E > E のQ @

The story: Three girls sitting in a room.

The story: Three girls sitting in a room. Each wears a red colored or white colored hat.

(ロ)、(型)、(E)、(E)、 E) の(の)

The story:

Three girls sitting in a room.

Each wears a red colored or white colored hat.

Teacher asks each one of them to guess the color of their own hat.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The story:

Three girls sitting in a room.

Each wears a red colored or white colored hat.

Teacher asks each one of them to guess the color of their own hat. They obviously have no clue!

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Initiated in 1950s, the study of epistemic logic has a rich history.

Many applications in computer science, economics.

Logic that reasons about knowledge.

Initiated in 1950s, the study of epistemic logic has a rich history.

Many applications in computer science, economics.

Examples are robotics, network security, study of social interactions etc.

Puzzle 2

<□ > < @ > < E > < E > E のQ @

The story: 100 prisoners standing in a line. Each can see everyone ahead of him but none behind him. Each wears a red or a white hat.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

The story: 100 prisoners standing in a line. Each can see everyone ahead of him but none behind him. Each wears a red or a white hat. Jailor starting from the last guy asks each prisoner to guess color of his own hat.

The story:

100 prisoners standing in a line.

Each can see everyone ahead of him but none behind him.

Each wears a red or a white hat.

Jailor starting from the last guy asks each prisoner to guess color of his own hat.

Jailor kills a prisoner if he gives a wrong answer.

The story: 100 prisoners standing in a line. Each can see everyone ahead of him but none behind him. Each wears a red or a white hat. Jailor starting from the last guy asks each prisoner to guess color of his own hat. Jailor kills a prisoner if he gives a wrong answer.

How many people will die?

The story: 100 prisoners standing in a line. Each can see everyone ahead of him but none behind him. Each wears a red or a white hat. Jailor starting from the last guy asks each prisoner to guess color of his own hat.

?

Jailor kills a prisoner if he gives a wrong answer.

How many people will die?

Lots of people may die

All may die.

Lots of people may die

All may die.

If each choses either red or white arbitrarily; all may die.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Lots of people may die

All may die.

If each choses either red or white arbitrarily; all may die. All but one may die.

(ロ)、(型)、(E)、(E)、 E) の(の)

Lots of people may die

All may die.

If each choses either red or white arbitrarily; all may die.

All but one may die.

If atleast one red (white) hat last prisoner says red (white, respectively), others copy. This will save atleast one person. In worst case exactly one person will survive.

Can atleast 50 (half) survive?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

Can atleast 50 (half) survive?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

Can atleast 50 (half) survive?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Idea: Majority

Can atleast 50 (half) survive?

Idea: Majority

The last prisoner says red (white) if majority is red (white, respectively).

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Everyone else sticks to that answer.

Can atleast 50 (half) survive?

Idea: Majority

The last prisoner says red (white) if majority is red (white, respectively).

Everyone else sticks to that answer.

Note again, the goal for everyone is to save most of the people.

Can atleast 50 (half) survive?

Idea: Majority

The last prisoner says red (white) if majority is red (white, respectively).

Everyone else sticks to that answer.

Note again, the goal for everyone is to save most of the people. Not necessarily save oneself.

Can we save 99?

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ = ● ● ●

Can we save 99?

Idea: Notice each prisoner computes a function.

Solution	strategy	function
1	none	constant function
2	last computes; others copy	∨ (OR)
3	last computes; others copy	majority

Majority is an involved function (provavbly harder to compute) as compared to the constant function or the OR function. Leads to saving more people.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Can we save 99?

Idea: Notice each prisoner computes a function.

Solution	strategy	function
1	none	constant function
2	last computes; others copy	∨ (OR)
3	last computes; others copy	majority

Majority is an involved function (provavbly harder to compute) as compared to the constant function or the OR function. Leads to saving more people.

Increase the complexity of functions each prisoner computes-to save more people.

Can we save 99?

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ = ● ● ●

Can we save 99?

Parity:

Say red = 1 and white = 0.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Can we save 99?

Parity:

Say red = 1 and white = 0.

Last prisoner says red (white) if he sees odd (even, respectively) number of red hats ahead of him.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Can we save 99?

Parity: Say red= 1 and white= 0. Last prisoner says red (white) if he sees odd (even,respectively) number of red hats ahead of him. ... solution from here is easy.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Can we save 99?

Parity:

Say red = 1 and white = 0.

Last prisoner says red (white) if he sees odd (even, respectively) number of red hats ahead of him.

... solution from here is easy.

Solution	strategy	function
1	none	constant function
2	last computes; others copy	∨ (OR)
3	last computes; others copy	majority
4	each computes	parity

The study of complexity theory deals with analysing the resources required to compute certain functions.

The study of complexity theory deals with analysing the resources required to compute certain functions. Let us only consider Boolean functions

・ロト・日本・モート モー うへぐ

The study of complexity theory deals with analysing the resources required to compute certain functions. Let us only consider Boolean functions $f : \{0,1\}^* \to \{0,1\}$

Examples:

The study of complexity theory deals with analysing the resources required to compute certain functions.

Let us only consider Boolean functions $f : \{0,1\}^* \rightarrow \{0,1\}$ Examples:

$$OR(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > 0 \\ 0 & \text{otherwise} \end{cases}$$

The study of complexity theory deals with analysing the resources required to compute certain functions.

Let us only consider Boolean functions $f : \{0,1\}^* \rightarrow \{0,1\}$ Examples:

$$OR(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > 0\\ 0 & \text{otherwise} \end{cases}$$
$$Majority(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > \lfloor \frac{n}{2}\\ 0 & \text{otherwise} \end{cases}$$

The study of complexity theory deals with analysing the resources required to compute certain functions.

Let us only consider Boolean functions $f : \{0,1\}^* \rightarrow \{0,1\}$ Examples:

$$OR(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > 0\\ 0 & \text{otherwise} \end{cases}$$
$$Majority(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > \lfloor \frac{n}{2} \rfloor\\ 0 & \text{otherwise} \end{cases}$$
$$Th^{\alpha}(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > \alpha\\ 0 & \text{otherwise} \end{cases}$$

The study of complexity theory deals with analysing the resources required to compute certain functions.

Let us only consider Boolean functions $f : \{0,1\}^* \rightarrow \{0,1\}$ Examples:

$$OR(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > 0\\ 0 & \text{otherwise} \end{cases}$$
$$Majority(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > \lfloor \frac{n}{2} \rfloor\\ 0 & \text{otherwise} \end{cases}$$
$$Th^{\alpha}(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) > \alpha\\ 0 & \text{otherwise} \end{cases}$$

$$\oplus(x_1, x_2, \dots, x_n) = \begin{cases} 1 & \text{if } (\sum_{i=1}^n x_i) \equiv 1 \pmod{2} \\ 0 & \text{otherwise} \end{cases}$$

Proposition

If we can compute Majority, we can compute Th^{α} for any integer α such that $0 \le \alpha \le n$.

Proposition

If we can compute Majority, we can compute Th^{α} for any integer α such that $0 \le \alpha \le n$.

Proof.

Proof by example (!): Say $\alpha = 2$.

Proposition

If we can compute Majority, we can compute Th^{α} for any integer α such that $0 \leq \alpha \leq n$.

Proof.

Proof by example (!): Say $\alpha = 2$. Then

$$Th^{2}(x_{1}, x_{2}, \ldots, x_{n}) = Majority(x_{1}, x_{2}, \ldots, x_{n}, y_{1}, y_{2}, \ldots, y_{n})$$

Proposition

If we can compute Majority, we can compute Th^{α} for any integer α such that $0 \leq \alpha \leq n$.

Proof.

Proof by example (!): Say $\alpha = 2$. Then

$$Th^{2}(x_{1}, x_{2}, \ldots, x_{n}) = Majority(x_{1}, x_{2}, \ldots, x_{n}, y_{1}, y_{2}, \ldots, y_{n})$$

where, $y_1 = 1, y_2 = 1, \dots, y_{n-1} = 1$, and $y_n = 0$.

Proposition

If we can compute Majority, we can compute Th^{α} for any integer α such that $0 \leq \alpha \leq n$.

Proof.

Proof by example (!): Say $\alpha = 2$. Then

$$Th^{2}(x_{1}, x_{2}, ..., x_{n}) = Majority(x_{1}, x_{2}, ..., x_{n}, y_{1}, y_{2}, ..., y_{n})$$

where, $y_1 = 1, y_2 = 1, \dots, y_{n-1} = 1$, and $y_n = 0$. Easy to see that the proof generalises for any α .

Proposition

If we can compute Th^{α} for any integer α such that $0 \leq \alpha \leq n$, then we can compute \oplus .

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Proposition

If we can compute Th^{α} for any integer α such that $0 \leq \alpha \leq n$, then we can compute \oplus .

Proof.

$$\oplus(x_1,x_2,\ldots,x_n)=\bigvee_{i=0}^{\lfloor\frac{n}{2}\rfloor}[Th^{2i+1}(x_1,x_2,\ldots,x_n)\wedge Th^{2i}(x_1,x_2,\ldots,x_n)]$$

Proposition

If we can compute Th^{α} for any integer α such that $0 \leq \alpha \leq n$, then we can compute \oplus .

Proof.

$$\oplus(x_1,x_2,\ldots,x_n)=\bigvee_{i=0}^{\lfloor\frac{n}{2}\rfloor}[Th^{2i+1}(x_1,x_2,\ldots,x_n)\wedge Th^{2i}(x_1,x_2,\ldots,x_n)]$$

Majority is harder than *Th* which is harder than \oplus .

Putting together polynomially many AND, OR, and NOT functions, cascaded not more than O(1) times

Putting together polynomially many AND, OR, and NOT functions, cascaded not more than O(1) times **can not** compute \oplus .

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Putting together polynomially many AND, OR, and NOT functions, cascaded not more than O(1) times **can not** compute \oplus .

Proving such results (lower bounds) is highly non-trivial.

vaguely, one needs to say all possible such combinations fail

Putting together polynomially many AND, OR, and NOT functions, cascaded not more than O(1) times **can not** compute \oplus .

Proving such results (lower bounds) is highly non-trivial.

vaguely, one needs to say all possible such combinations fail

evidence: decades of efforts has yielded only a few results

Putting together polynomially many AND, OR, and NOT functions, cascaded not more than O(1) times **can not** compute \oplus .

Proving such results (lower bounds) is highly non-trivial.

- vaguely, one needs to say all possible such combinations fail
- evidence: decades of efforts has yielded only a few results
- pessimism: some techniques have been classified as useless for proving such results

How hard is \oplus ?

Putting together polynomially many AND, OR, and NOT functions, cascaded not more than O(1) times **can not** compute \oplus .

Proving such results (lower bounds) is highly non-trivial.

- vaguely, one needs to say all possible such combinations fail
- evidence: decades of efforts has yielded only a few results
- pessimism: some techniques have been classified as useless for proving such results
- > optimism: because so less is known, there is a lot to discover!

Puzzle 3

<□ > < @ > < E > < E > E のQ @

The story:

Seven students sitting in a circle. Each wearing either a red or a white hat.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Each can see all but his own hat.

The story:

Seven students sitting in a circle. Each wearing either a red or a white hat.

Each can see all but his own hat.

The teacher asks them to guess the color of their own hat and write it on a piece of paper.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The story:

Seven students sitting in a circle. Each wearing either a red or a white hat.

Each can see all but his own hat.

The teacher asks them to guess the color of their own hat and write it on a piece of paper.

They can either write a color or write 'pass'.

The story:

Seven students sitting in a circle. Each wearing either a red or a white hat.

Each can see all but his own hat.

The teacher asks them to guess the color of their own hat and write it on a piece of paper.

They can either write a color or write 'pass'.

They can talk to each other before they wear the hats but never after that.

The story:

Seven students sitting in a circle. Each wearing either a red or a white hat.

Each can see all but his own hat.

The teacher asks them to guess the color of their own hat and write it on a piece of paper.

They can either write a color or write 'pass'.

They can talk to each other before they wear the hats but never after that.

The students win if no one gives a wrong answer and atleast one person answers.

The story:

Seven students sitting in a circle. Each wearing either a red or a white hat.

Each can see all but his own hat.

The teacher asks them to guess the color of their own hat and write it on a piece of paper.

They can either write a color or write 'pass'.

They can talk to each other before they wear the hats but never after that.

The students win if no one gives a wrong answer and atleast one person answers.

The teacher wins, if even one student gives a wrong answer.

100	1 р р	1
101	р0р	1
110	рр0	1
111	000	0

Observe: Each student speaks on 4 inputs out of 8. Each student is right on 2 and wrong on 2 inputs. When correct; others say pass, i.e. he is alone. When wrong; all are together wrong.

Observe: Students are correct with probability $\frac{3}{4}$

Strategies

Strategy: If equal number of red and white then 'pass' else invert the value.

As stated this does not generalise.

Is there a better way of stating it, which will generalise?

Codes

Codes are functions such that $f : \{0,1\}^k \to \{0,1\}^n$ with k < n (injective, with size of the range $= 2^k$).

Codes

Codes are functions such that $f : \{0,1\}^k \to \{0,1\}^n$ with k < n (injective, with size of the range $= 2^k$).

The codewords can be chosen to be vectors that are pairwise far away. This helps for error correction.

Codes

Codes are functions such that $f : \{0,1\}^k \to \{0,1\}^n$ with k < n (injective, with size of the range $= 2^k$).

The codewords can be chosen to be vectors that are pairwise far away. This helps for error correction.

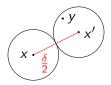

Figure: x and x' are δ apart. y corrected to its nearest neighbor x'

Codes

Codes are functions such that $f : \{0,1\}^k \to \{0,1\}^n$ with k < n (injective, with size of the range $= 2^k$).

The codewords can be chosen to be vectors that are pairwise far away. This helps for error correction.

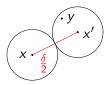

Figure: x and x' are δ apart. y corrected to its nearest neighbor x'

By nearest codeword argument, a code with distance d can correct up to $\lfloor \frac{d}{2} \rfloor$ errors.

Codes

Codes are functions such that $f : \{0,1\}^k \to \{0,1\}^n$ with k < n (injective, with size of the range $= 2^k$).

The codewords can be chosen to be vectors that are pairwise far away. This helps for error correction.

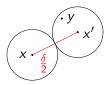

Figure: x and x' are δ apart. y corrected to its nearest neighbor x'

By nearest codeword argument, a code with distance d can correct up to $\lfloor \frac{d}{2} \rfloor$ errors. Hence, with distance 2 or 3 one error can be corrected.

View of every student lacks one bit less
